Role of Identity, Identification, and Receipts for Consent

Privacy as Expected: Consent Gateway (PAECG) Project funded by 

Harshvardhan J. Pandit | pandith@tcd.ie | @coolharsh55

ADAPT Centre, Trinity College Dublin, Ireland

Vitor Jesus, Shankar Ammai

PrivDash Ltd., United Kingdom | (former: Birmingham City University, UK)

Mark Lizar, Salvatore D'Agostino

OpenConsent, London, United Kingdom

This work has been funded under the European Union's Horizon 2020 research and innovation programme NGI TRUST Grant#825618 for Project#3.40 Privacy-as-Expected: Consent Gateway. Harshvardhan J. Pandit is also funded by Irish Research Council Government of Ireland Postdoctoral Fellowship Grant#GOIPD/2020/790; and ADAPT SFI Centre for Digital Media Technology funded by Science Foundation Ireland through SFI Research Centres Programme and co-funded under European Regional Development Fund (ERDF) through Grant#13/RC/2106_P2.

Search customization

Get more relevant results and recommendations by using your Google searches from this browser.

Off On

YouTube History

Get features like tailored video recommendations and a customized homepage. This setting uses your activity on YouTube, like videos you watch and things you search for.

Off On

Ad personalization

Have Google show you tailored ads in Search, YouTube, and across the web that are based on your activity, like things you search for on Google and videos you watch on YouTube.

Off On

Ad personalization on Google Search

See more relevant ads when you're using Google Search

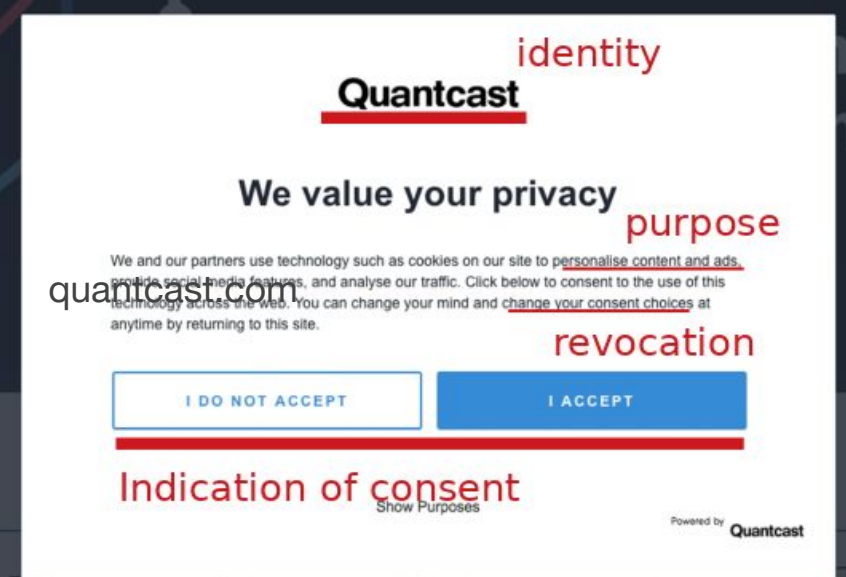

Off On

Ad personalization on YouTube & across the web

See more relevant ads on YouTube and on sites across the web that use Google services to show ads

Off On

Indication of consent

Show Purposes

Powered by Quantcast

Consent should be:

- Freely given → without coercion, no obligation
- Specific → exact and limited in scope
- Informed → prior knowledge
- Un-ambiguous → clear indication of consenting
- Revocable → once given, can be withdrawn

- GDPR Art. 4-11 (2016)

GDPR says:

- 1) Collect valid consent (legal requirements)
- 2) Provide ability to withdraw given consent**
- 3) Provide rights (applicable to certain contexts)
- 4) Don't collect additional information

e.g. to validate identity merely for the purposes of identification for consent (data minimisation)

Resulting scenario:

- If user has an account, consent is tied to the account
- If user does not have an account, how to handle consent?
- If temporary identifiers are utilised, how to ensure data minimisation?

Two biggest challenges

slide#4

Cookies (default choice for local data management for the web)

- Ephemeral storage → collect universal consent with local control
- Non-transparent → opening the cookie jar requires expertise
- Non-transferable → cookies are per device, per app, per profile
- Conditional → if no cookie, no control of preference
- Lack of control → no user-utilisation of cookie or cookie-data
- Non-challengeable → no user-ability to verify or challenge
- Un-manageable → browsers only give ability to delete cookies

Notices:

- a) (privacy is the) “biggest lie on the internet” -- [OO20]
- b) the web is full of dark patterns and malpractices -- [SBM20, Ur20]

Do Not Track (DNT) → boolean (set on / off) browser signal to indicate user does not want to be 'tracked' across the websites. Last standardisation via W3C in 2019. All browsers implement it. No websites it. Spectacular failure. <https://www.w3.org/TR/tracking-dnt/>

Global Privacy Control (GPC) → boolean (set on / off) browser signal to indicate user does not want their data to be 'shared' beyond the website/controller. Last specification Jan 2021. Only 1 browser currently implements it - Brave. Some websites support it. Legally enforceable under CCPA. Uncertain regarding GDPR¹.
<https://globalprivacycontrol.github.io/gpc-spec/>

Privacy Labels → Apple introduced notices for its App Store which requires developers to post information about data collected and used for tracking of individuals, in addition to requiring them to ask consent for tracking - and provides a global setting to prohibit such requests. The company dogfoods: <https://www.apple.com/privacy/labels/>

¹ GPC + GDPR: will it work?. Harshvardhan J. Pandit. 2021. <https://harshp.com/research/blog/gpc-gdpr-can-it-work>

- 1) A **consent receipt** is similar in principle to a record of transaction issued as a receipt, whether in grocery stores, or shopping websites.
- 2) Kantara published Consent Receipt (2018) specification outlining a schema for issuing 'receipts' for given consent.
 - a) How to deploy? Does it meet legal requirements?
 - b) ANCR working group (2021) initiated to upgrade spec.
- 3) ISO/IEC 29184 (2020) standard for online privacy notices for consent
 - a) mentions possibility of machine-readable metadata.
 - b) ISO/IEC announced 27560 (likely publication >2023) as an upcoming standardisation effort for consent receipts.
- 4) "Web of Receipts": using receipts as proof and record of transactions, and establishing trust through transparency and accountability [Je20]

Two problems with the way consent works today:

- 1) Consent records do not concern authentication or verification of entities and information → they are only data records
- 2) Creating receipts requires proactive participation by Controllers

Three challenges that need to be addressed to solve this:

- a) Any entity must be able to create its own records
- b) Receipts must be capable of specifying and verifying identity
- c) Avoiding ‘my word against yours’ type of situations

PaE:CG is a project funded under NGI TRUST (OCT-2020 to JUN-2021) that provides an end-to-end, user-centric, comprehensive, open source solution to managing Consent for Personal Data.

The driving principle for PaE:CG is utilising receipts for an accountable mechanism while ensuring the Internet as it currently is and should remain for the most part a pseudo-anonymous space, while still empowering individuals with choice and control through consent.

- ❖ Consent interaction → Consent Receipt
- ❖ All parties must benefit from receipts regardless of participation
- ❖ Receipts are cryptographically signed for assurance & verification
- ❖ Novel concept of 'Consent Gateway' as a Notary or Witness

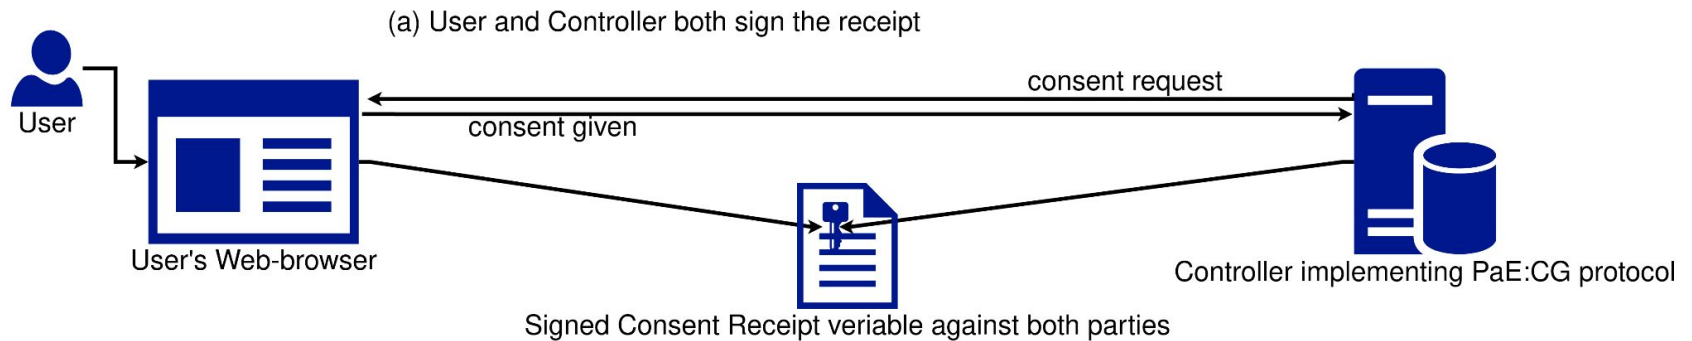

- PAECG protocol :: implementation of developed solution
- Receipt uses bearer tokens to provide cryptographic guarantees regarding identity when receipts are generated and signed
- Receipts *can be* a form of De-centralized Identifier (DID)
- Therefore, receipts can be utilised to provide an *identifer* for identification in interactions, e.g. consent withdrawal
- Receipts, by acting as an identification mechanism, can also be used wherever identity is required, e.g. rights exercising
- Controller benefits by having verifiable records, non-invasive identifiers for consent and rights management
- Users benefits by having proof of consent, and accountable record of their consent interaction

Scenario #1: All Parties utilise PAECG protocols

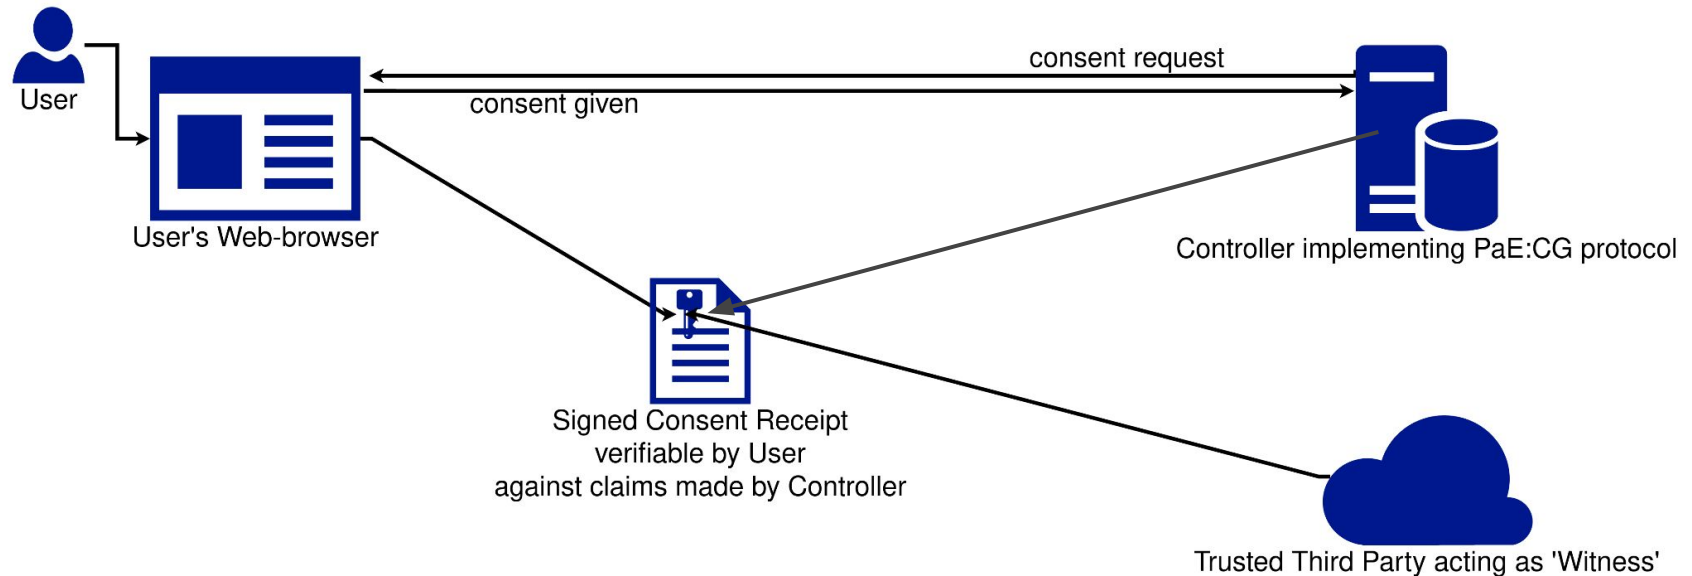

slide#10

1. User has a browser plugin as *User Agent*
2. Controller implements PAECG protocol on server
3. Both generate Consent Receipt
4. Both sign Consent Receipt
5. Both hold copies of signed Consent Receipt

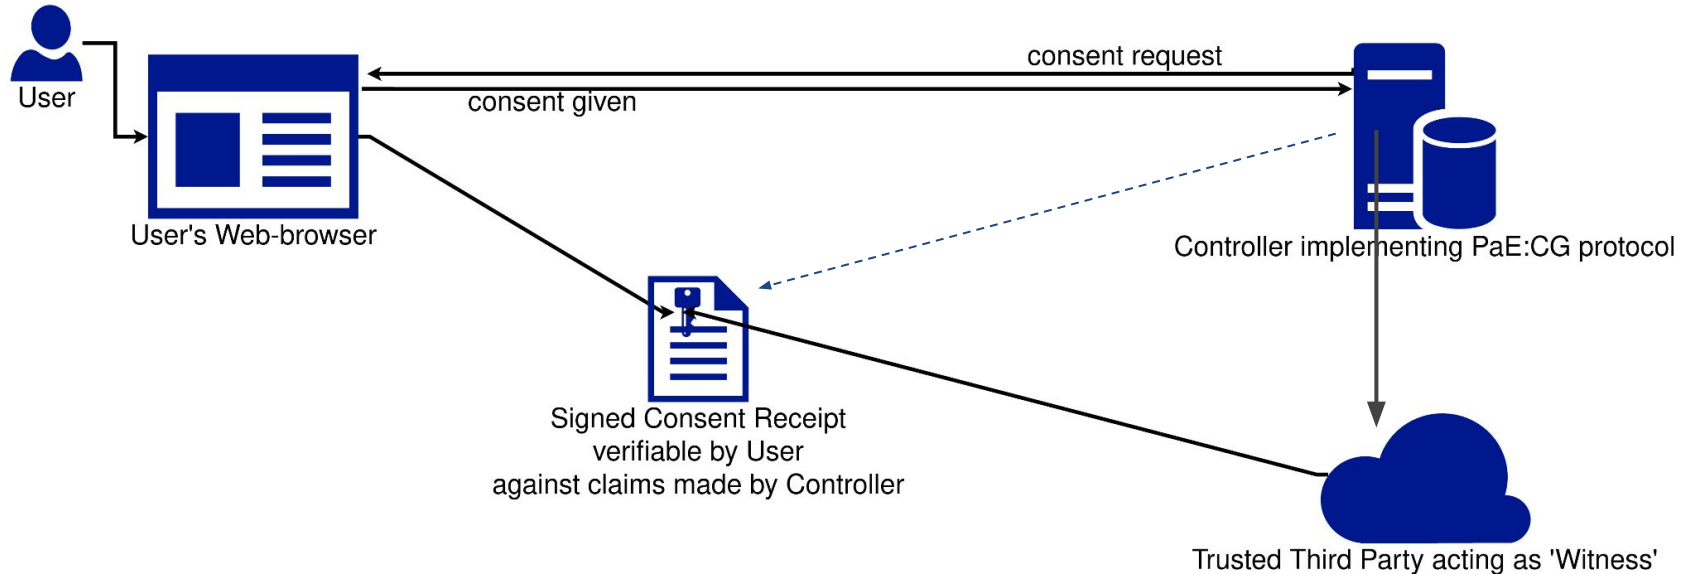

(b) Controller does not sign the receipt; Witness signs the receipt to record consent transaction

1. User has a browser plugin as *User Agent*
2. Controller implements PAECG protocol on server
3. Both generate Consent Receipt
4. Both + CG sign Consent Receipt
5. Both hold copies of signed Consent Receipt

(b) Controller does not sign the receipt; Witness signs the receipt to record consent transaction

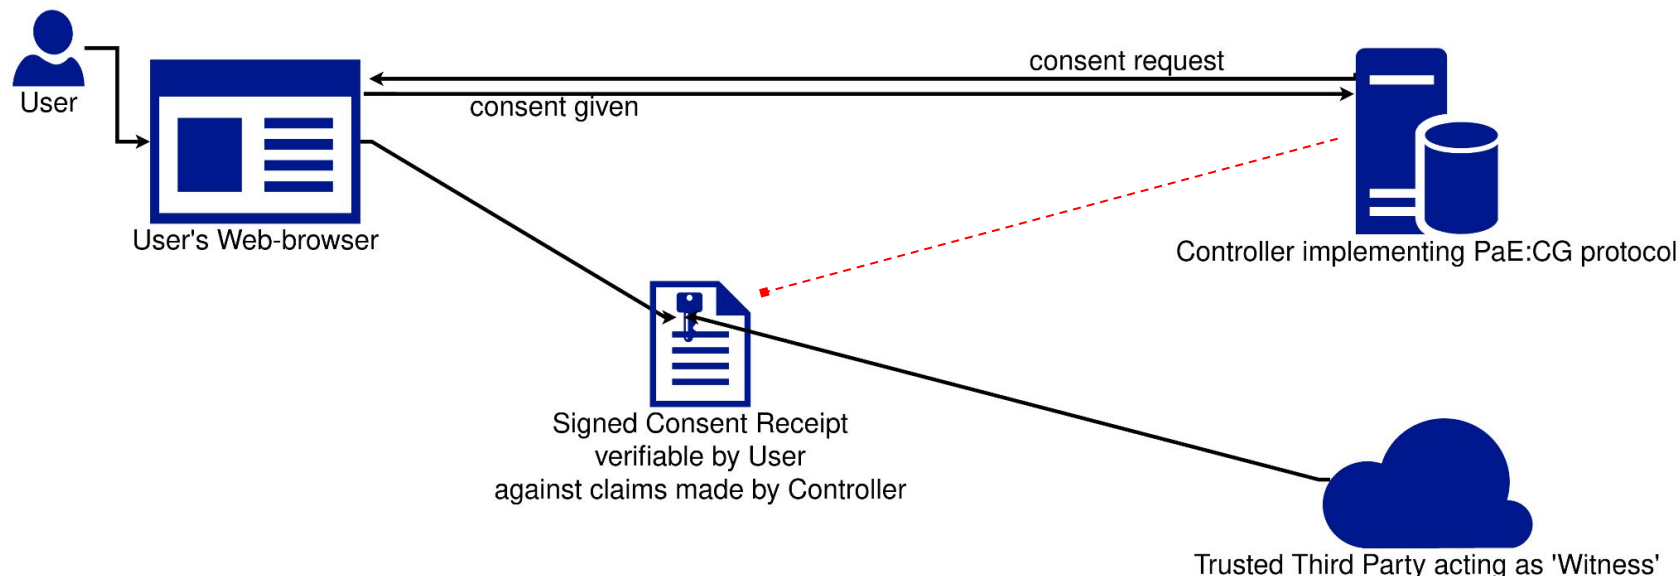

1. User has a browser plugin as *User Agent*
2. Controller does not implement PAECG protocol on server
3. Both generate Consent Receipt
4. User + CG (on behalf of Controller) sign Consent Receipt
5. Both hold copies of signed Consent Receipt

Scenario #3: Controller does not sign

slide#13

(b) Controller does not sign the receipt; Witness signs the receipt to record consent transaction

1. User has a browser plugin as *User Agent*
2. Controller implements PAECG protocol on server
3. User generates Consent Receipt
4. User + CG (as Witness) sign Consent Receipt
5. User has signed Consent Receipt

Credentials / Signing

- 1) Explicit keys provided by each party
- 2) Utilise certificates used for websites (e.g. HTTPS/TLS)

Information within Receipt

- 1) Self-declaration, e.g. website explicitly lists it in web-page
- 2) Annotated semantics, e.g. website implicitly lists elements which can be extracted from web-page
- 3) Derived, e.g. take information from consent notices using NLP
- 4) Provided, e.g. third party public registry of information

- The issue of ‘accountable consent’ is a web-scale problem
- PAECG provides a solution for practical accountability and implementation using cryptographic protocols
- Introduces the novel concept of a ‘Consent Gateway’
- Receipts can be utilised as records of consent, for accountability, legal enforcement, further interactions, identification and authentication, and clarification in disputes.
- Contributions to ongoing standardisation efforts in ISO/IEC, Schema.org, Kantara ANCR, W3C DPVCG, and more.
